

eVo

Motorized Therapy System

*Therapy***Motions**

Moving people to a better life

eVO

“evolution: an unfolding; process of development or change...”

The eVO System from Therapy Motions represents a new and energizing approach to physical therapy and rehabilitation equipment.

Its innovative motorized technology provides safe and effective coordinated reciprocating movement to both the upper and lower extremities simultaneously.

The eVO is proven to be effective for persons who are uncomfortable with, or cannot use, conventional physical fitness or rehabilitation equipment.

eVO advances Therapy with the Power of Motion!

Only the eVO System provides reciprocating full-body motion in three effective modes:

“Continuous Passive Motion”

CPM provides a range of motion without voluntary movement of the limb.

Passive range of motion has recognized therapeutic benefits including reduced inflammation of the affected joint, improved range of motion, pain relief and enhanced functional mobility.

“Active-Assisted Motion”

Active-assisted exercise is used to facilitate voluntary movement of the limb(s), thereby decreasing the amount of strength needed to move the joints.

Active-assisted motion provides the necessary physical stimulus to improve cardiovascular endurance, muscular strength and neurologic coordination.

“Active-Driven Motion”

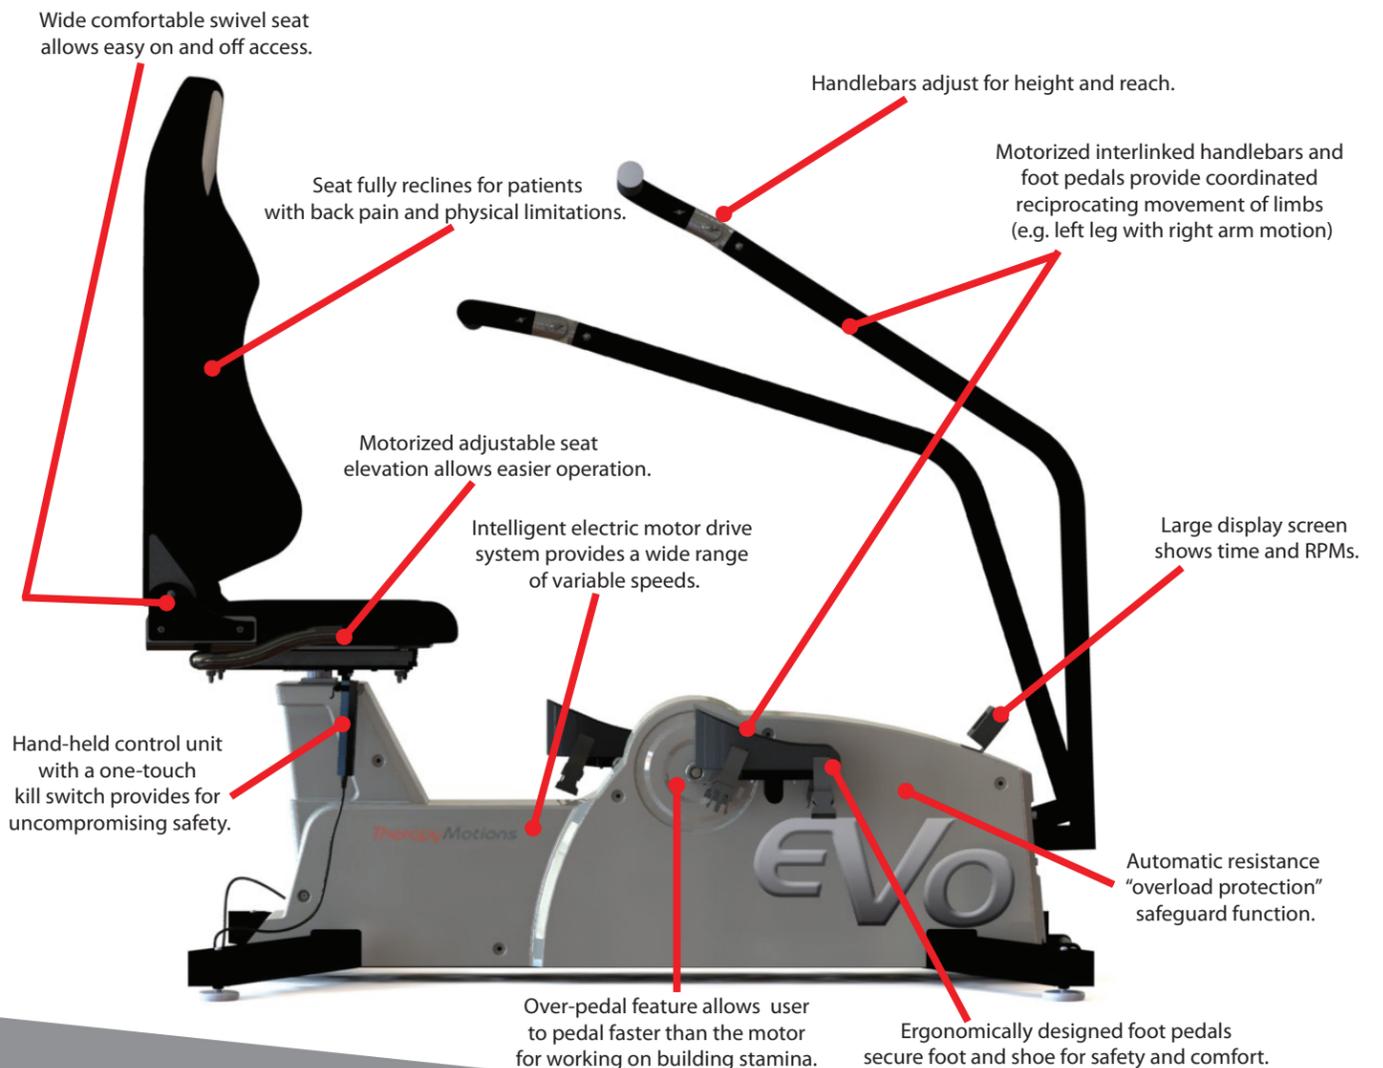

The person has attained sufficient muscular strength to operate the system on his/her own power, over-riding the speed of the motor for full manual operation.

Active motion provides ongoing strength building as well as personal and emotional well-being.

The eVO System is designed for individuals who require:

- 1) **REHABILITATION TO REGAIN STRENGTH AND/OR USE OF THEIR LIMBS**
Stroke victims, traumatic brain injuries, spinal cord injuries, cardiac surgery patients
 The eVO can provide variable intense physical therapy to maximize the potential for recovery.
- 2) **PREVENTION THERAPY TO WARD OFF SPASTICITY AND PERMANENT CONSTRICTION OF THEIR LIMBS**
Cerebral Palsy, Multiple Sclerosis, brain injuries, spinal cord injury
 The eVO's passive mode can prevent contractures by gently stretching spastic muscles.
- 3) **MAINTENANCE EXERCISES TO SUSTAIN MUSCULATURE AND STRENGTH**
Multiple Sclerosis, Parkinson's Disease, Muscular Dystrophy
 The eVO can provide vital exercise, encouraging nerves to continue functioning normally

eVO has been designed for your patients' safety and benefit:
